Lenovo ThinkPad SL400 dealsThe Lenovo ThinkPad line is aimed at business users, but the new SL range is focused exclusively on small businesses and domestic workers looking for business style, but also more basic features. You'll find the usual ThinkPad style and attention to detail, but less attention is paid to the prevalence of peripherals. The Lenovo ThinkPad SL400 (579 euro inc. VAT) is a smaller model in the range and uses a 14.1-inch Super-TFT panel, as opposed to the 15.4-inch screen on the SL500. The screen helps to keep the weight up to a portable 2.6 kg. Battery life on the first day as the SL400 managed to last for 282 minutes in the test. The heavy volume cover has the usual ThinkPad style and recessed bezel, but it doesn't have a latch to keep the lid closed. The overall build quality of the laptop is great, with thick plastic being used throughout. There is a high-gloss lid, but the main case has a standard matte finish. The keyboard on this smaller model feels a little cramped compared to the larger SL500. However, the keys feel remarkably reliable and the action is solid. There is a pointing stick as well as a separate touchpad and there are also two sets of mouse buttons. When it comes to performance, this is one of the slowest machines in this test. Based on the latest Intel Core 2 Duo processor, you'll find the T5670, which runs at 1.8 GHz, is adequate for daily tasks, but doesn't offer much stock to perform multiple tasks comfortably. The 2048MB memory it comes with is enough to download and run Windows Vista Business OS, but we suggest adding more memory if you really need more performance from this laptop. Cool runningGraphics are handled by the Integrated Intel GMA 4500MHD solution, which is part of the Intel chipset. Integrated graphics helps keep energy consumption down and we found this quiet and cool laptop. Even after using it for long periods of time, it still felt cool to touch around the keys as well as the base. Stacking the main chassis hides the ports on the sides of the hull, which limits damage during transit, but also means that finding ports can be inconvenient. There is a fingerprint scanner built into the mean time, which adds an extra layer of security to the laptop. Like all recent ThinkPad models, the 3G module is installed in standard mode and comes with 30-day free access via Vodafone.The Lenovo ThinkPad SL400 won't suit everyone, since its performance is basic, but it makes up for it in being compact with longer battery life. Lenovo has repeatedly shown us that they mean business when it comes to Windows 8.1 devices. From various convertible-style laptops in his yoga line to his famous Family ThinkPad, there is no shortage of cool and aggressive products in his portfolio. During the last Peppcom Digital Experience event in New York, we were able to take a quick look at the Lenovo ThinkPad 10 - a 10-inch, full-scale Windows 8.1 tablet that people are taken aback with its \$600 starting cost. So, what's there to say about design? Nothing really, seeing that it takes its cues from the beloved ThinkPad line. Despite the fact that it is a tablet, we can take to notice the enterprise-oriented design of thinkPad 10, as it has a streamlined, lightweight case covered with matte finish. Generally speaking, it's a tried and out and true design that we've seen recycled on multiple Lenovo tablets, so we're not so shocked by the revelation here. Sporting a 10.1-inch 1920 x 1200 IPS display, this is something pretty nice to find knowing that we're dealing with Atom-based tablets here. With its better resolution than the full HD resolution, which produces a pixel density count of 224 ppi, our eyes are able to soak in its details and richness. Other than that, we can't find anything too unusual with the display, since it has all the nice elements we want in the panel - like neutral color reproduction and decent viewing angles. Of course, to please a wide group of users, Lenovo ThinkPad 10 runs Windows 8.1, a full-scale PC operating system, of course. Not only does it have access to the full range of tablet optimized applications that are in the Windows Store, but it is capable of running old-school legacy software. Wearing the name ThinkPad, tablet business targets and corporate users, but it's still a fun tablet of sorts that's great for multimedia consumption. One area that we feel is ecstatic, the tablet quad core 1.6 GHz Intel Atom No3795 processor with 2GB of RAM is not screaming powerful. Rather, it will handle the most basic processes like surfing the web and sometimes performance software, but don't think for a moment it's a game or processor-intensive thing. Nowadays just check it out, it produces a reasonable performance with minimal wobble. However, we need to strain it with some other things to really appreciate its value. Stuffed with a 64GB hard drive, this is hardly something we'd be inclined to say as enough for a full-blown Windows 8.1. Even so, we take solace in finding a microSD card slot on its side ready to supplement its capacity. For the tablet, its 8-megapixel rear camera with LED flash seems like a decent tally that lurks along the top left corner at the back. Fortunately, the camera lens is washed to the surface - so there are no strange protrusions. Accommodation is naturally in an ideal location because it is away from the sides of the pill where we usually understand it. Finally, there is also a front-facing camera that can be used for these video chat sessions. The more we look at the Lenovo ThinkPad 10 at a \$600 cost, the more we feel that it's just a smidgen pricey considering its Atom CPU packaging - as opposed to something like 4th generation Core processors. Being an Atom-based pill, we would prefer to have its prices drop below the \$500 mark. In contrast, however, we need to test his performance power power see whether the price point is justified. For those of you people thinking about choosing this, Lenovo has an arsenal of accessories in addition to the tablet - like a cover that comes complete with a digitalizer handle, charging dock and keyboard dock. SIGN UP FOR OUR NEWSLETTER! The Lenovo ThinkPad 13 is an almost perfect performance companion for small business owners. It's hard to fault this medium-sized laptop that easily ticks almost every box on its way to becoming my favorite laptop of middle class work. First, its keyboard is not only good - it's the best I've ever tested. The laptop also has long battery life, excellent security and durability, a sharp 13-inch display, and a lightweight design that won't weigh you down on your commute. And starting for as little as \$611, it's a theft. DesignCommuters will appreciate the portable design of ThinkPad 13: The system measures 0.78 inches thick and weighs about 3.14 pounds., which is pretty sleek for a \$611 machine. It's easy enough tote back and forth between home and office, anyway. There are subtle options if you are willing to pay a little more. These include Asus' \$699 (0.66 inches thick, 2.6 pounds.). But the ThinkPad 13 is more durable than any of these systems. Lenovo says the system offers military-grade strength and has been tested to withstand short drops, dini, vibration, extreme temperatures and humidity. Despite its mid-range price, the ThinkPad 13 feels just as tough and durable as expensive models such as the ThinkPad T460 - which is a big drag if you need to lug the system around on business trips. Most of the ports that an employee may want are present on ThinkPad 13. The right edge of the system has two USB 3.0 ports to connect to existing accessories; A full-size HDMI port to connect your laptop to a desktop display or projector; and the USB Type-C port. On the left edge there is an additional USB 3.0 port and a Lenovo OneLink docking port that will connect to the old docking stations. Customers can choose between two colors for ThinkPad 13. I tested a silver model that sported a beautiful matte-silver lid and keyboard deck. There's also a black model that looks more like a classic ThinkPad.KeyboardThinkPads are known for their top-notch keyboards, but this is the one I'd choose for a marathon set session. In fact, the ThinkPad 13 has the most beautiful keyboard feel I've ever used on any laptop, bar no. It offers an extremely generous 1.94 millimeter key travel, well above the 1.5mm we look at in the laptop. Deeper keys are better because they provide a more comfortable, desktop typing experience. In addition, the keys offer clear, quick reviews of each stroke. The system is not choice to enter in low light though, because the keyboard lacks backlighting. This is typical of laptops in this price range, however. While I absolutely love the ThinkPad 13 keyboard, I'm less excited about the laptop laptop x 2.1-inch touchpad that has a little too much friction on its surface. This meant that my finger was not always able to slide smoothly, and I noticed the cursor sometimes jumped a bit when I clicked the icons and highlighted the text. Multifinger gestures, such as scrolling two fingers, felt quite responsive, however. SecurityFor only an additional \$10, an additional fingerprint scanner can be added to the ThinkPad 13, which provides a good security boost during everyday use. The scanner is only available on a black model; my silver review unit is not one, so I haven't had a chance to check it out. I know that the scanner is an older swipe-based reader. This may work fine, but I've found that swipe-based readers aren't as reliable as one-touch fingerprint scanners on premium models like the ThinkPad T460s.Otherwise, ThinkPad 13 offers security credentials well enough to please corporate IT departments. It offers standard security features such as encrypting hardware spreadsheets and documents. The full-HD panel has a resolution of 1920 x 1080 pixels, which is a good sweet spot for a laptop of this size. The text looks clear, but the colors can be brighter. The display is really bright, too, topping up at 241 nits of brightness. This outshines rivals like the Toshiba Tecra C40 (205 nit), although the zenBook UX305C (319 nits) is even brighter. Battery lifeThe ThinkPad 13 will last through your longest working flights with ease. The system worked for an impressive 9 hours and 13 minutes on our battery test, which simulates continuous browsing of web pages over Wi-Fi. It comfortably beats the category average of 8 hours and 13 minutes, and it's wallops Tecra C40 (6:49). The Asus' zenBook UX305C lasted a little longer on our battery test, finally dying after 9 hours and 48 minutes. PerformanceThe ThinkPad 13 features are not very impressive on paper, but the performance of the system is more than sufficient for daily work tasks. My review unit came with a 2.3GHz Core i3-610U processor, 4GB of RAM and 128GB of solid drive (SSD) storage. It sped along pretty well during moderate multitasking, and I didn't notice any slowdown while I edited a large spreadsheet with about 10 tabs open in my Firefox web browser. The system scored a respectable score of 5.230 on the Geekbench 3 test, which measures overall performance. This is the middle of the road score beats m3-equipped Asus zenBook UX305C (4810), but it lags behind the Core i5-6200U powered Toshiba Tecra C40 (5.783). Keep in mind that ThinkPad 13 is also available with multiple Core i5 processors that are better at preparing demanding workloads. Teh Teh 13 also did very well on our test tables, matching 20,000 names to their addresses in 5 minutes and 33 seconds. This comfortably beats the category average of 7 minutes and 12 seconds, although the zenBook UX305C (6:01) and Tecra C40 (4:29) were faster. ConfigurationsLenovo sells the ThinkPad 13 in several hardware configurations. The basic model comes with an Intel Core i3-6100U processor with 4GB of RAM and 128GB of SSD memory, for \$611. You can opt for various updates when you buy the system through Lenovo.com. I highly recommend getting at least a Core i5-6200U processor, a \$70 upgrade that will greatly improve the system's multitasking capabilities. Intel vPro functionality is only available with the Core i5-6300U processor, with a \$150 upgrade. You can also upgrade your RAM to 16GB (8GB is recommended for most workers) and storage up to 512GB (256GB is a good sweet spot for a business machine). Despite its starting price of \$611, the ThinkPad 13 goes head-to-head with laptops that cost hundreds of dollars more. Workers will love its bright, crisp 13-inch display and its lightning-fast performance, as well as its strong safety and durability credentials. Passengers, meanwhile, will appreciate its light design and long battery life. And if your job involves clacking away on a keyboard for hours, there's no better laptop anywhere. The ThinkPad 13 is not perfect, however. Its slightly jittery touchpad is a bit frustrating, and other systems are more portable, including the more expensive Dell XPS 13 and the Asus zenBook UX305C. But workers looking for a business-class laptop at an affordable price won't find a better companion for performance than the ThinkPad 13. 13.
